There are essentially two ways to load and use your data in Google Colab.

1. **Drop your data into Runtime Files and then load it. (Runtime's files will be deleted when the runtime is terminated.)**
   - Drag and drop your files into the "Files" section.

   - By right-clicking, you can access and copy the path of your files.

   - You can obtain your datasets as pandas.DataFrames using the path of your files.
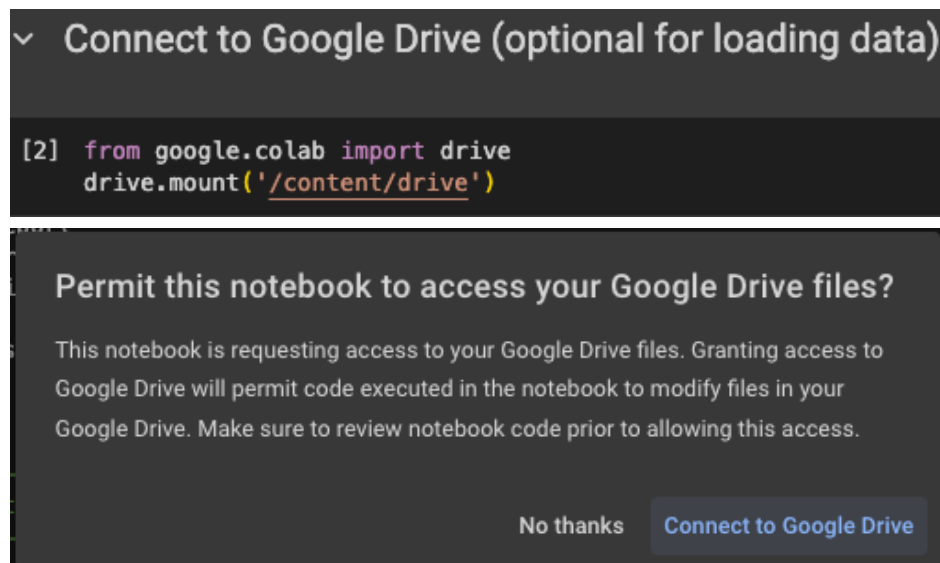

2. Upload your data to your Google Drive and then load it.

- Upload your data to your Google Drive.

- Go to the 'Connect to Google Drive' section in the homework notebook and run the code, and grant access to your drive.

- You can obtain your datasets as pandas.DataFrames using the path of your files.
